

From manual comment review to controlled rule updates

THE BUSINESS PROBLEM

Every daily state fee schedule contains thousands of rows with free-text comments written by analysts.

- A person must read each comment and decide whether the rule needs to change.
- The review takes significant time and can vary by reviewer.
- The workload grows as more states and fee schedules are added.

THREE BUSINESS OUTCOMES

WHAT WE BUILT

A secure AI workflow reads each comment, checks the current rule, and determines the next action.

- 1 Read the comment**
Understand the analyst instruction and the business context.
- 2 Check the current rule**
Compare the comment with the rule already configured in the system.
- 3 Determine the action**
Return a clear outcome with confidence and an explanation.

Secure automation with clear human oversight

HOW THE SOLUTION IS POWERED

- Azure OpenAI**
Microsoft's secure enterprise AI service runs inside the company cloud environment. The workflow keeps business data within the secured environment.
- Purpose-built instructions**
A pre-trained language model receives specific instructions for one task: read the comment, compare it with the rules, and report what should change.
- Business-focused output**
The solution returns the action, confidence score, and plain-English explanation instead of exposing technical implementation details.

SAFETY AND TRUST CONTROLS

- 85%**
Confidence required before an automatic change can proceed
- HUMAN**
Any result below the threshold goes to a reviewer instead of being guessed
- WHY**
Every decision includes a plain-English explanation
- AUDIT**
Every applied or deferred decision is logged
- EMAIL**
A summary email provides visibility after every run

BUSINESS IMPACT

BEFORE Hours or days of manual comment review	NOW Minutes to review and process the same work	CONTROL Consistent decisions, clear explanations, and human review when needed
